For Video of The PowerCost Monitor™!

Blue Line Powercost Monitor

Quick Overview

Get the low-down on what your house is costing you in Kilowatts or dollars. Clip it to your meter and start making sense of your bills. It's that easy.

Product Description

Its 4pm. Do you know what your house is doing? The PowerCost meter will tell you. This easily installed gadget transmits data from your electricity meter to an in-home LCD that displays how much power your house is using and how much that power costs you. The PowerCost meter can not only help you pinpoint where the power hogs are, it also allows you to track when your household burns the most money. The straightforward two part system consists of a Sensor Unit attached directly to the outside of your electric meter and the Power Monitor display unit, which is wireless, and can be located in any room of the house for easy reference. The sensor can be attached and detached without impacting the meter. The monitor can sit on a counter or be mounted on the wall. Both the sensor and monitor are battery operated (batteries included).

Nitty Gritty

Included are one display unit, one sensor unit, an installation guide, setup guide, user's manual, installation DVD, and 4 AA alkaline batteries.

Customer Reviews

- 1. Easy, fun, money-saving** Review by janet m - After seeing the electricity monitoring on your website we thought we'd give it a try. The Blueline is very easy to install, easy to use, wireless which we love, and it's certainly made an impact in how we use electricity. I would recommend it to anyone. (Posted on 7/7/09)
- 2. Start here** Review by Lisa - Monitoring your power usage is key. We like this monitor because it's easy to install and wireless. Our family takes turns putting the display next to their bed, so the information is right there for them to see. Even the teenager is running back to turn off lights. (Posted on 7/1/09)
- 3. Revolutionized the way we think of electric energy** Review by PT - We've been using our Blue Line for about 10 days and it has produced a marked shift in everyone's behavior. The toaster, coffee pot and, of course, the now hated dryer (that adds about \$1.00/kwh when it's running) have been EXPOSED. The kids are engaged. An innate understanding of what's on and what our electricity use should be at any given time has developed. When the monitor shows a high number, and it isn't readily explained, the kids are off in search of the culprit. Too soon to tell what our savings will be, but I'm betting on it being better than the 20% the Canadian researchers say results from the simple act of monitoring.

Do not pass go. If you want to get started with dealing with your home energy, you need to get a monitor. (Posted on 12/8/08)
